Think VIN is just for **small animal** veterinarians? *Think again!*
With a VIN membership, you can fit over 100,000 helpful colleagues in your truck. Get all the resources, support, and community you need to enhance your equine practice in one place — VIN!

|| *VIN is a handy resource for me to have in the field. I can quickly look up drug doses for less common medications. I often search images to compare questionable areas I find on imaging. The Message Boards are where I learn about news related to medications, regulations, and other events important in practice.* ||

Victoria Bentley, DVM, ACVS | VIN Consultant

GET EVERYTHING
YOU NEED FOR YOUR
EQUINE PRACTICE
IN ONE PLACE!

VIN VETERINARY DRUG HANDBOOK (VVDH)

Available on VIN and as a mobile app, the VVDH has all the formulary amenities you'd expect: accurate, referenced dosing, space for your notes, and loads more! From dosage calculators to Clinical Pearls from experts in the field to Client Information Sheets, it's like having a pharmacist in your pocket.

Whether you're researching on your laptop at the clinic or trying to figure out an appropriate dose in the glow of your truck headlights, VIN is the colleague you need when times get rough. Equine practitioners spend a lot of time alone, and the VVDH is there to support you from the clinic to the field.

SPECIALTY CENTERS

The Equine Specialty Center gathers the essential equine information and resources on VIN into one place for easy browsing. You'll find an entire Diagnostics Center created by clinical pathologists, anesthesia and analgesia resources, a slide show with best practices for equine hoof radiography, and more.

Think of the Equine Specialty Center as a friendly farm dog, saving you time by rounding up and neatly organizing all the best, most relevant information and tools on VIN for equine practitioners. That kind of assistance can make your days in practice even more efficient and effective!

MESSAGE BOARDS

The VIN Message Boards are home to a community of 230+ VIN Consultants and over 115,000 colleagues. In the **Equine Message Board folder**, you can get case support from boarded surgeons and internists, topic specialists in podiatry and equine dentistry, and your colleagues in general practice.

Between nights in the barn, days on the road, patients that seem to aim for self-destruction, and demanding clients, it's good to feel like someone has your back. On VIN, you can easily get help from specialists and colleagues in fields ranging from alternative medicine to zoonotic diseases.

PROCEDURE VIDEOS

The Exero video collection documents procedures and surgeries, often shot from a first-person perspective. The Mentor procedure video collection primarily focuses on emergency procedures and includes step-by-step instructions, as well as a materials list for each procedure.

Whether you're contemplating a new procedure, teaching a student or new associate, or just needing a memory refresher, having the visuals in video form can help jog your memory and help you prepare your team. Just think, a handy checklist means no more racing back to the truck for the "one thing" you forgot!

3D ANATOMY

Featuring faithfully rendered 3D models of the equine skull/teeth, limbs, and abdomen, 3D Anatomy is a revolutionary, interactive way to deeply explore and master anatomy. Sort by tissue type, rotate in any plane, and refresh your anatomy in three dimensions without resorting to formalin-laden cadavers.

Understanding anatomy is critical for equine veterinarians — and clients! Prep for a new procedure, be on point with your nerve blocks, mentor new associates, and give clients a look inside their horses with this essential equine anatomy resource.

EQUINE PODIATRY

Renowned equine podiatry expert and VIN Equine Consultant Steve O'Grady has graciously made his equine podiatry resources available on VIN. Laminitis? Corns? White line disease? Dr. O'Grady covers it all and more in recorded VIN Rounds, articles, Message Board posts, and visual media.

Every horseperson knows the saying, "no hoof, no horse." The majority of equine lamenesses begin in the foot, and many veterinarians haven't had the training in biomechanics needed to properly address these conditions. If you want to get a leg up on your equine podiatry, this is the place to start!
